

MCS, triangulation, and clique-tree grammar extraction

Conceptual local graph example

1. Local skeleton

M=movie, D=director,
C=country, G=genre
4-cycle has no chord

2. MCS + triangulation

The fill edge is only for
decomposition; it is not a
new KG triple.

3. Clique tree

Each bag becomes one local
grammar rule with external
attachment nodes.

Why this matters for retrieval

- Offline: repeated clique-tree bags become HRG-like structural priors.
- Online: matching relation-path signatures helps rank compact executable evidence instead of expanding every BFS neighbor.
- The triangulation edge is a decomposition artifact, not an added reverse relation or new KG fact.
