

Fallback sources: failure forms and recovery methods

Every fallback candidate is revalidated against the KG before retrieval.

LLM correction Observed failure form Failure: relation alias or wrong order How it is recovered Recovery: ask LLM to repair failed hop, then KB-validate Example directed -> directed_by	KG-valid fallback Observed failure form Failure: no parsed chain is executable How it is recovered Recovery: enumerate local executable chains from the grounded entity Example Linda Evans -> starred_actors -> directed_by	HRG-supported fallback Observed failure form Failure: many executable chains compete How it is recovered Recovery: use grammar hit, ordered path, and grammar score for ranking Example prefer common actor-movie-director pattern	GrammarFirst diagnostic Observed failure form Failure: LLM hop/chain prior is wrong How it is recovered Recovery: HRG path-bank first, KG executable filtering second Example entity seed -> HRG path-bank -> KG path

Important boundary

Executability solves syntax; semantic relevance still needs relation cues, answer type, and ranking.
